Set-up of Pixsys controllers
USB converter PC>Controller
Firmware upgrade

» **Description**

Memory Cards are optional tools, specifically conceived to simplify and speed-up the setting/configuration of Pixsys controllers.

Several versions are available: parameters storage only; parameters storage and battery; flash memory for firmware upgrade.

The version with integrated battery allows a quick and error-saving setting of all parameters without requiring external power supply of the controller. The version including Flash memory enable the upgrade of firmware version according to new releases.

Beside the basic function to duplicate parameters, the USB port (available on the model with integrated battery) is also enabling the connection to PC and to LabSoftView software.

» **Technical data**

Battery full charge enables approx 1000 programmings.
